Subject: CINDA Master File Comparison

NDS compared the three CINDA Master Files from NNDC, NEA-DB and NDS.

The number of differences in the three files is in the order of more than 1000 entries. Almost all of the differences can be identified to originate from a fairly small number of mishaps, which are summarized in section B below.

A number of trivial differences was removed, when possible, before file comparison; see the following section A.

To cure the encountered differences it is suggested

- first, that mistakes are corrected, and that procedures are improved to avoid similar mistakes in future;
- second, that each center retransmits the entire file of its own area to the other centers.

Details will have to be discussed at the forthcoming NRDC Meeting.

A Trivial differences

1. NNDC has lower case letters. (For the file comparison these have been changed to upper case.) NDS would prefer that all centers adopt lower case for element, alphabetic energies, Conf-codes, authors.  
  
→ To be discussed at NRDC Meeting.
2. There were differences in operation codes. (For the file comparison these were set to blank.)  
  
→ This indicates differences in file update procedures.
3. There were differences for leading blanks and leading zeros in A, serial numbers and block numbers. (For the file comparison leading blanks were changed to zeros.)  
  
→ Not disturbing.
4. NEA-DB had added NDG in En-min, where the other centers had a blank. (For the file comparison, all occurrences of NDG were set to blank.)  
  
→ Will be corrected when NNDC and NDS retransmit their area files with En-min blank replaced by "/" for LDL.
5. Different cut-off dates: Obviously, there were CINDA batches in the mail at the cut-off date used for the file comparison. Batches from NNDC with entries dated 8901 and 8902 had not yet arrived in the NEA-DB and NDS files. Similarly, a batch with area 2 entries dated 8812 by reader ( had not yet arrived in the NNDC file).

B Serious differences

- 1.a. Many area 1 entries exist in all three files with identical entry date (mostly 8404) and identical serial-number, but in the NNDC file the content of the entry differs. The differences concern mostly the comments.  
  
→ Will be corrected when NNDC retransmits its area file.
- 1.b. Similarly, many area 2 entries exist with identical entry date (mostly 7711) and identical serial-number, where in the NNDC file the A-number differs from the other files by one or even two. This concerns not only RES or STF entries (where mistakes in A are relatively frequent) but also other quantities.

Apparently, NNDC has made on-line corrections some time ago. It must be checked whether these corrections are correct; if so, the corrected entries should be transmitted in the standard procedure.

- Action: NEA-DB to check which A-number is correct. This must be done before retransmitting the area file. See list 2.
- 2. There is a batch dated 8702 for reference 84GEESTH where entries are identical in all files, but NEA-DB has different serial numbers and date 870223 instead of 870224. It is not obvious how this happened.
  - Will be corrected when NEA-DB retransmits its area file.
- 3. Country codes. NNDC and NEA-DB have problems with country codes.
  - 3.a. For the Iranian lab AMU, both centers seem to have the wrong country code (Iraq) in their dictionaries.
    - Action: NEA-DB and NNDC to correct in their files and dictionaries.
  - 3.b. The conversion of the Egyptian country code UAR to EGY apparently created a mismatch. In the NNDC file the still existing UAR codes were converted by NDS to EGY before comparison. In the NEA-DB file many if not all entries from Egypt apparently got lost.

It is alarming that there had been correspondence about this item, but without success.

    - Will be solved when NDS retransmits its area file.
    - Action on NNDC and NEA-DB to verify that their dictionaries contain the correct country code.
  - 3.c. In the NNDC file there were invalid country codes ZZ2, ZZ3, ZZ4. (For the file comparison they were changed to ZZZ to agree with the other files.)
    - Action: NNDC to correct.
  - 3.d. In the NNDC file the invalid country code USL existed. (For the file comparison this was corrected to ISL.)
    - Action: NNDC to correct.
  - 3.e. In the NNDC file the invalid country code 9UK existed. The corresponding 2 entries showed up as missing in the NNDC file.
    - Action: NNDC to correct.
    - Further action: NNDC to revise procedures such that wrong country codes cannot occur.

4. For area 3 and 4 entries, NEA-DB often removed plus signs and points from out of the Comments text. This may originate from a wrong procedure with the author flags.

→ Action: NEA-DB to check that such changes can no longer occur.

5. NEA-DB changed the EXFOR accession-number G0004.004 to 77004.004. This happened although there was a telex exchange about this item.

→ Action on NEA-DB to correct.

6. Entry batches that did not arrive:

- 6.a. A batch of entries dated 8711 by reader + with 85SANTA revisions has not arrived in the NEA-DB file. (Mostly changes of hierarchy values.)

- 6.b. Batches with area 3+4 entries dated 8504, 8802, 8803 did not arrive in the NNDC file.

About the batch WIE276 with entries dated 8802 and 8803 there had been some correspondence. Apparently the batch had been loaded but only some of the entries arrived in the file. It seems that there were some problems which had not been followed up. In a similar way, batch WIE275 had been loaded but rejected, and the rejection escaped notice. This had been clarified by correspondence in Oct. 1988.

→ Will be solved when area files are retransmitted.

→ Action on NNDC: to improve procedures that it cannot be overlooked when something gets rejected.

7. Several other differences exist among the three files. Most of them are consequences from the fact that certain batches did not arrive at the one or other center.

For example: The NNDC file has many entries for 3YUGNJS which do not exist in the two other files. These would have been deleted if the NDS batch dated 8802 had been processed at NNDC.

There are various other differences which may originate in a similar way from unprocessed batches. It seems to be wasted time to analyze these small differences now before the major differences pointed out in items 1 to 5 have been corrected.

Files are sorted by BLOCKid: S,A,Q,LAB,BLOCK# then Serial Number, i.e. Serial Number is primary sorting sequence.

NOTE that many duplications of serial numbers have been found!! As the files are sorted by block-id first, these duplications are not evident in this compare exercise. As a duplication of serial numbers is against CINDA rules, it would be useful to examine the reason for duplication.

9 records found in NNDC file with invalid area code, these have been eliminated from the compare files.

List of differences eliminated or actions taken in this run:

1. all lower case letters translated to upper case
2. operation code in all files set to blank
3. leading blanks in A, Serial Number and Block Number changed to zeros
4. country codes: ZZ2, ZZ3, ZZ4 in NNDC file changed to ZZZ before compare
5. in most files, there are many errors in author flags being set or not; all author flags blanked out before compare
6. there are many cases of the update date not matching but the rest of the record matches; update dates not compared
7. in many cases, NEA-DB added NDG in energy field if it was blank; NDG in EMIN in all files set to blank before compare
8. the obsolete COUNTRY code UAR exists in NNDC file; all occurrences of this code have been changed to EGY before compare
9. the obsolete LAB code CHP exists in NNDC file; all occurrences of this code have been changed to CPR before compare
10. the invalid country code USL occurs in NNDC file, it is changed to ISL to match NEADB and NDS files (lab in Israel)

\* WARNING: this action may invalidate some desired checks!!

Files are sorted by BLOCKid: S.A.Q.LAB,Block# then Serial Number, i.e. Serial Number is primary sorting sequence.

NOTE that many duplications of serial numbers have been found!!  
 As the files are sorted by block-id first, these duplications are not evident in this compare exercise.  
 As a duplication of serial numbers is against CINDA rules, it would be useful to examine the reason for duplication.

9 records found in NNDC file with invalid area code, these have been eliminated from the compare files.

List of differences eliminated or actions taken in this run:

1. all lower case letters translated to upper case
2. operation code in all files set to blank
3. leading blanks in A, Serial Number and Block Number changed to zeros
4. country codes: ZZ2, ZZ3, ZZ4 in NNDC file changed to ZZZ before compare
5. in most files, there are many errors in author flags being set or not; all author flags blanked out before compare
6. there are many cases of the update date not matching but the rest of the record matches; update dates not compared
7. in many cases, NEA-DB added NDG in energy field if it was blank; NDG in EMIN in all files set to blank before compare
8. the obsolete COUNTRY code UAR exists in NNDC file; all occurrences of this code have been changed to EGY before compare
9. the obsolete LAB code CHP exists in NNDC file; all occurrences of this code have been changed to CPR before compare
10. the invalid country code USL occurs in NNDC file, it is changed to ISL to match NEADB and NDS files (lab in Israel)

\* WARNING: this action may invalidate some desired checks!!

Files are sorted by BLOCKid: S,A,Q,LAB,BLOCK# then Serial Number, i.e. Serial Number is primary sorting sequence.

NOTE that many duplications of serial numbers have been found!!  
 As the files are sorted by block-id first, these duplications are not evident in this compare exercise.  
 As a duplication of serial numbers is against CINDA rules, it would be useful to examine the reason for duplication.

9 records found in NNDC file with invalid area code, these have been eliminated from the compare files.

List of differences eliminated or actions taken in this run:

1. all lower case letters translated to upper case
2. operation code in all files set to blank
3. leading blanks in A, Serial Number and Block Number changed to zeros
4. country codes: ZZ2, ZZ3, ZZ4 in NNDC file changed to ZZZ before compare
5. in most files, there are many errors in author flags being set or not; all author flags blanked out before compare
6. there are many cases of the update date not matching but the rest of the record matches; update dates not compared
7. in many cases, NEA-DB added NDG in energy field if it was blank; NDG in EMIN in all files set to blank before compare
8. the obsolete COUNTRY code UAR exists in NNDC file; all occurrences of this code have been changed to EGY before compare
9. the obsolete LAB code CHP exists in NNDC file; all occurrences of this code have been changed to CPR before compare
10. the invalid country code USL occurs in NNDC file, it is changed to ISL to match NEADB and NDS files (lab in Israel)

\* WARNING: this action may invalidate some desired checks!!
